

The Core Components of React Native

 JavaScript Mastery

Core Components

React Native provides a number of built-in **Core Components** ready for you to use in your mobile app. Let's learn about some of them! 🔥

1 - View

In React Native, **View** is a built-in component. If you are familiar with **div** in HTML, **View** is like a **div** - it's a content area where you display your content.

```
import { View, Text } from 'react-native';

const MyView = () => (
  <View>
    <Text>Hello, View!</Text>
  </View>
);

export default MyView;
```

2 - Text

Text is an essential built-in component. It displays text in the application. The **Text** component supports nesting, styling, **and touch handling**.

```
import { Text } from 'react-native';

const MyText = () => (
  <Text>Hello, Text!</Text>
);

export default MyText;
```

3 - Image

The **Image** component displays different images, including network images, static resources, temporary local images, **and images from local disks, such as the camera roll.**

```
import { Image } from 'react-native';

const MyImage = () => (
  <Image
    source={{ uri: 'https://reactnative.dev/img/tiny_logo.png' }}
    style={{ width: 50, height: 50 }}
  />
);

export default MyImage;
```

4 - TextInput

A foundational component for **inputting text into the app via a keyboard.**

Props provide configurability for several features, such as auto-correction, auto-capitalization, placeholder text, and different keyboard types, such as a numeric keypad.

```
<View>
  <TextInput
    placeholder="Type here"
    value={text}
    onChangeText={setText}
  />
</View>
```

5 - ScrollView

ScrollView renders extensive lists or meaningful content within a scrollable view, **complete with a scrollbar.**

It helps users view critical content that exceeds the screen size.

```
import { ScrollView, Text } from 'react-native';

const MyScrollView = () => (
  <ScrollView>
    <Text>Scroll me!</Text>
  </ScrollView>
);

export default MyScrollView;
```
